Abstract of the Disclosure

The method makes possible to keep particular e-mails separate from other e-mails and is based upon an interaction between a plug-in program in the user's e-mail client program and a separate mediating server. User's private address and e-mail service address are saved in the mediating server. E-mail client program is programmed to send all private messages to the mediating server. When a message is sent the plug-in program removes the original user given recipient address on the recipient field temporarily to another field, and replaces it with the address of the mediating server. To the user the message appears to have been sent to the original recipient. The mediating server receives the messages, replaces the sender's address with the sender's private address in the mediating server, restores the original recipient address(es), from the other field of the message, to the recipient field(s) and sends the message to the original recipient(s).
